This is the comprehensive "2026 Architect" roadmap. In this era, companies aren't looking for someone who just types code—they want someone who can design systems that use AI to solve problems.

Since you are 16 and in Morocco, you have a unique advantage: you can build a professional-grade portfolio before you even finish your Baccalaureate.

Phase 1: The "Low-Level" Logic (Months 1–3)

AI-generated code is often inefficient. Understanding how the computer actually handles data makes you the "Senior" in the room who can fix what the AI breaks.

1. C & Memory Management

- **Focus:** Pointers, Structs, and Manual Memory Allocation (`malloc` , `free`).
- **Source:** **CS50x (Harvard via edX)** – This is the gold standard. Watch the C weeks specifically.
- **Source:** **Beej's Guide to C Programming** – A free, high-quality text for deep-diving.

2. Data Structures & Algorithms (DSA)

- **Focus:** Arrays, HashMaps, Trees, and Big O Notation.
- **Source:** **NeetCode.io** – Start with the "Roadmap" section. It's the best way to practice coding interviews.
- **Source:** **FreeCodeCamp (Python for DSA)** – Great for visual learners.

Phase 2: The Modern AI Stack (Months 4–7)

The industry has moved beyond simple JavaScript. You need "Type Safety" and "Orchestration."

1. TypeScript & Next.js

- **Focus:** Transforming your JS skills into TS. Building "Serverless" apps.
- **Source:** **The Official Next.js Learn Course** – Extremely hands-on.

- **Source:** [Total TypeScript (Zod/Beginner)] – Matt Pocock's free tutorials are essential for 2026.

2. AI Engineering (APIs & RAG)

- **Focus:** Learning how to connect an LLM to a database (Retrieval-Augmented Generation).
- **Source:** [DeepLearning.ai (Short Courses)] – Specifically "AI Agents" and "Generative AI for Beginners" by Andrew Ng.
- **Source:** [LangChain Docs] – Learn how to "chain" AI thoughts together.

Phase 3: Agentic Systems & Databases (Months 8–10)

In 2026, the best apps don't just "talk"; they "do."

1. Agentic Frameworks

- **Focus:** Building AI that can use tools (like searching Google or editing a file).
- **Source:** [LangGraph (Python/JS)] – This is the current state-of-the-art for building AI agents that don't get stuck in loops.

2. Vector & Relational Databases

- **Focus:** SQL (PostgreSQL) for standard data + Vector DBs (Pinecone or Weaviate) for AI "long-term memory."
- **Source:** [Supabase University] – Excellent tutorials on modern database management.

Phase 4: The Moroccan Career Launch (Months 11–12)

Your goal is to become "un-ignorable" in the local and international market.

1. The "1337" Strategy

- **Action:** Apply for the "Piscine" (the 4-week pool) at [1337.ma].

- **Tip:** Even if you are 16, look into their "Bac Exception." It is the most prestigious way to get hired by companies like **OCP**, **HPS**, or **Bank Al-Maghrib**.

2. GITEX Africa (Marrakech - April 2026)

- **Action:** Attend this event. It is the center of the African tech world.
- **Networking:** Bring a QR code on your phone that links to your GitHub. Talk to startups in the "North Africa" sector.

3. Building "The One" Project

- **Idea:** Build an AI tool that solves a Moroccan problem.
  - *Example:* An AI-powered legal assistant for Moroccan "Code de la Famille" or a Darija-to-English professional translator.
- **Source:** Use **Vercel** to host it for free.

Summary Table for 2026

Topic	2026 Requirement	Recommended Tool
Language	Type-Safe & Fast	**TypeScript / Python**
Framework	Full-Stack	**Next.js 15+**
AI	Agentic / RAG	**LangChain / Gemini API**
Deployment	Edge / Serverless	**Vercel / AWS Amplify**

Would you like me to help you set up a "Hello World" project in TypeScript and Next.js that connects to an AI API so you can see how it feels?
